Introduction

Healthcare systems face challenges such as long waiting times, overcrowding, and difficulty in obtaining quick medical consultations. This project aims to provide a digital system that helps patients analyze their symptoms and receive preliminary medical recommendations in a fast and efficient way.

Methodology

The system follows a structured process to analyze symptoms and provide recommendations.

INPUT SYMPTOMS
The user enters their symptoms and related information.

ANALYZE SYMPTOMS
The Rule-Based System analyzes the symptoms based on medical knowledge.

ASSESS SEVERITY
The system evaluates the severity level of the condition.

GENERATE RECOMMENDATIONS
The system generates preliminary diagnosis and healthcare recommendations.

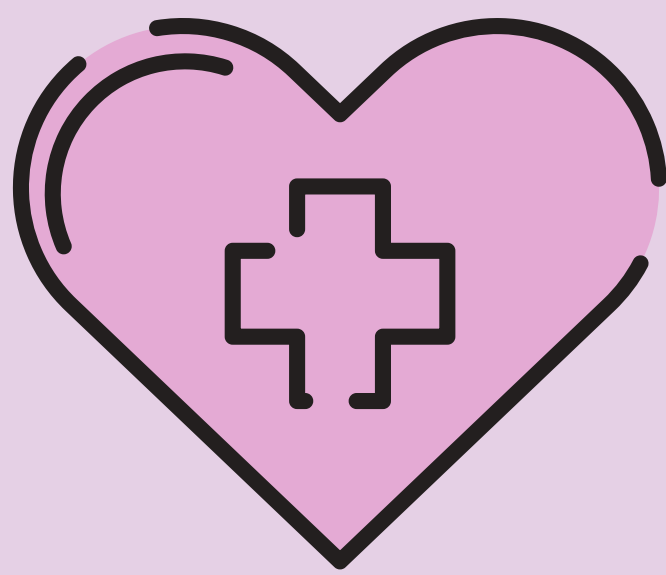

DIRECT TO APPROPRIATE SERVICE
The user is guided to the most appropriate healthcare service based on their condition.

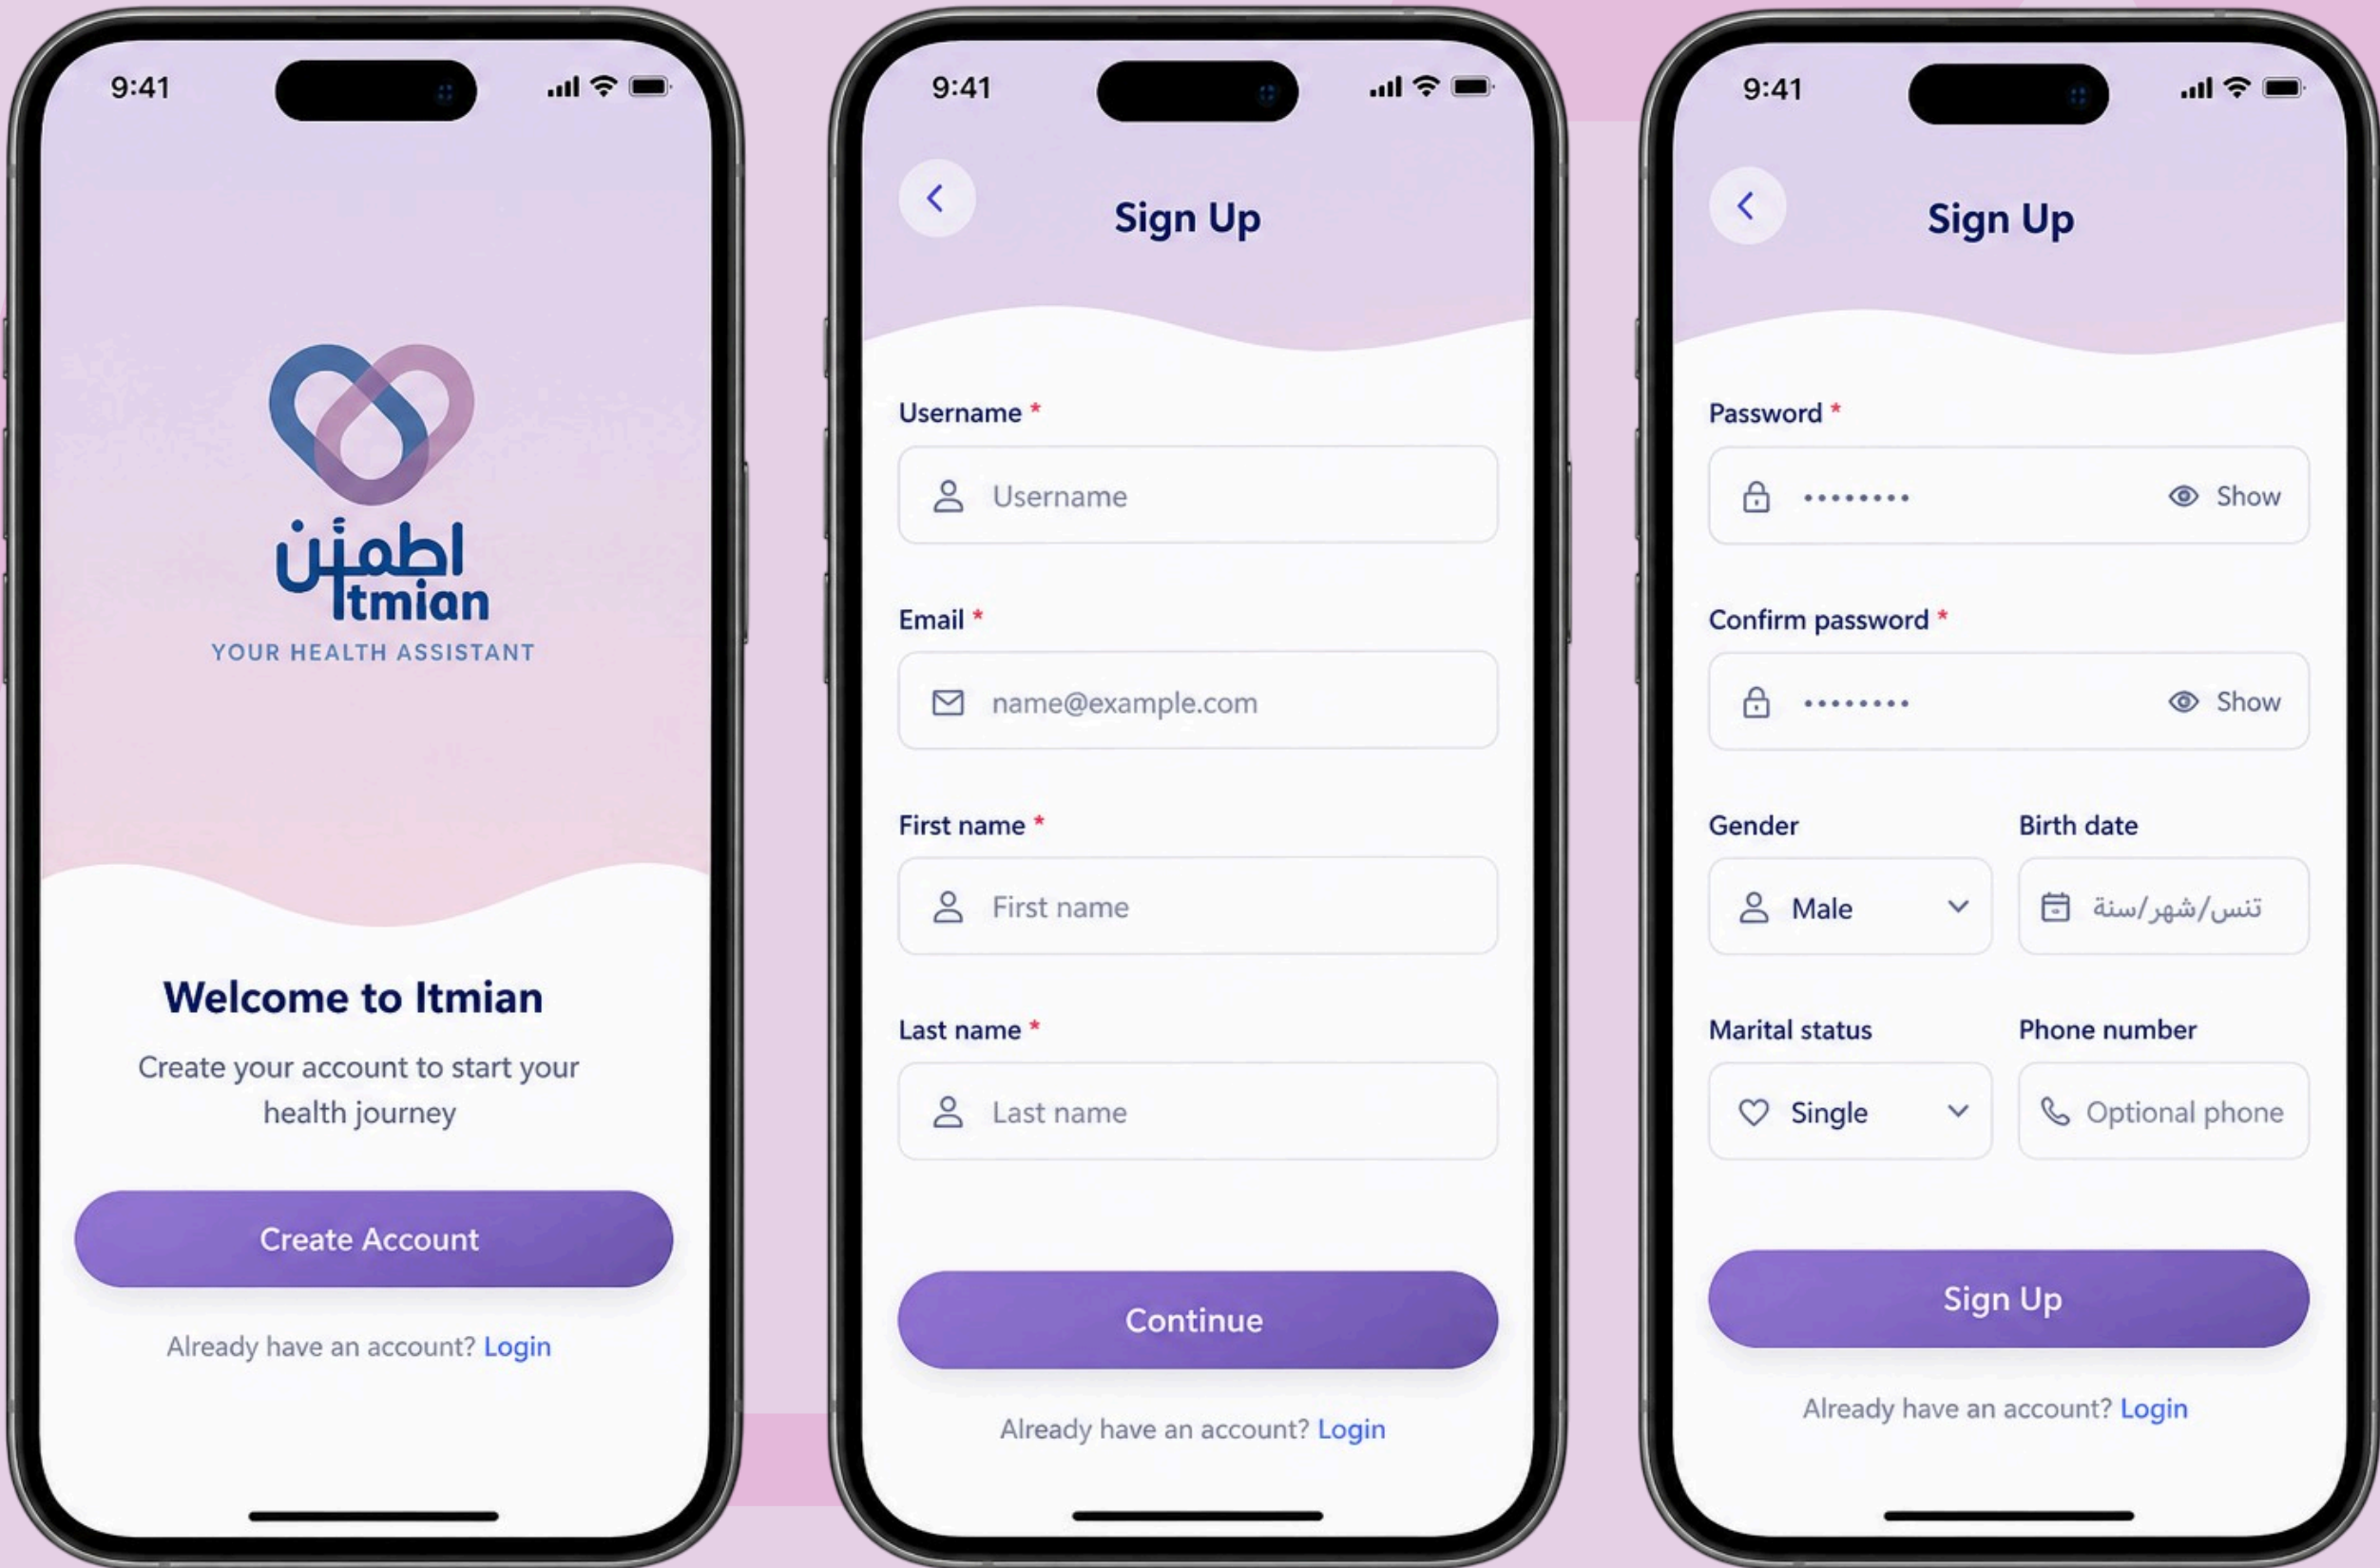

Conclusion

The system provides an integrated solution for analyzing symptoms and converting them into preliminary medical reports. It helps reduce the burden on healthcare facilities and improves the user experience. The system can be further developed in the future by incorporating a broader medical dataset and a dedicated mobile application.
