Introduction

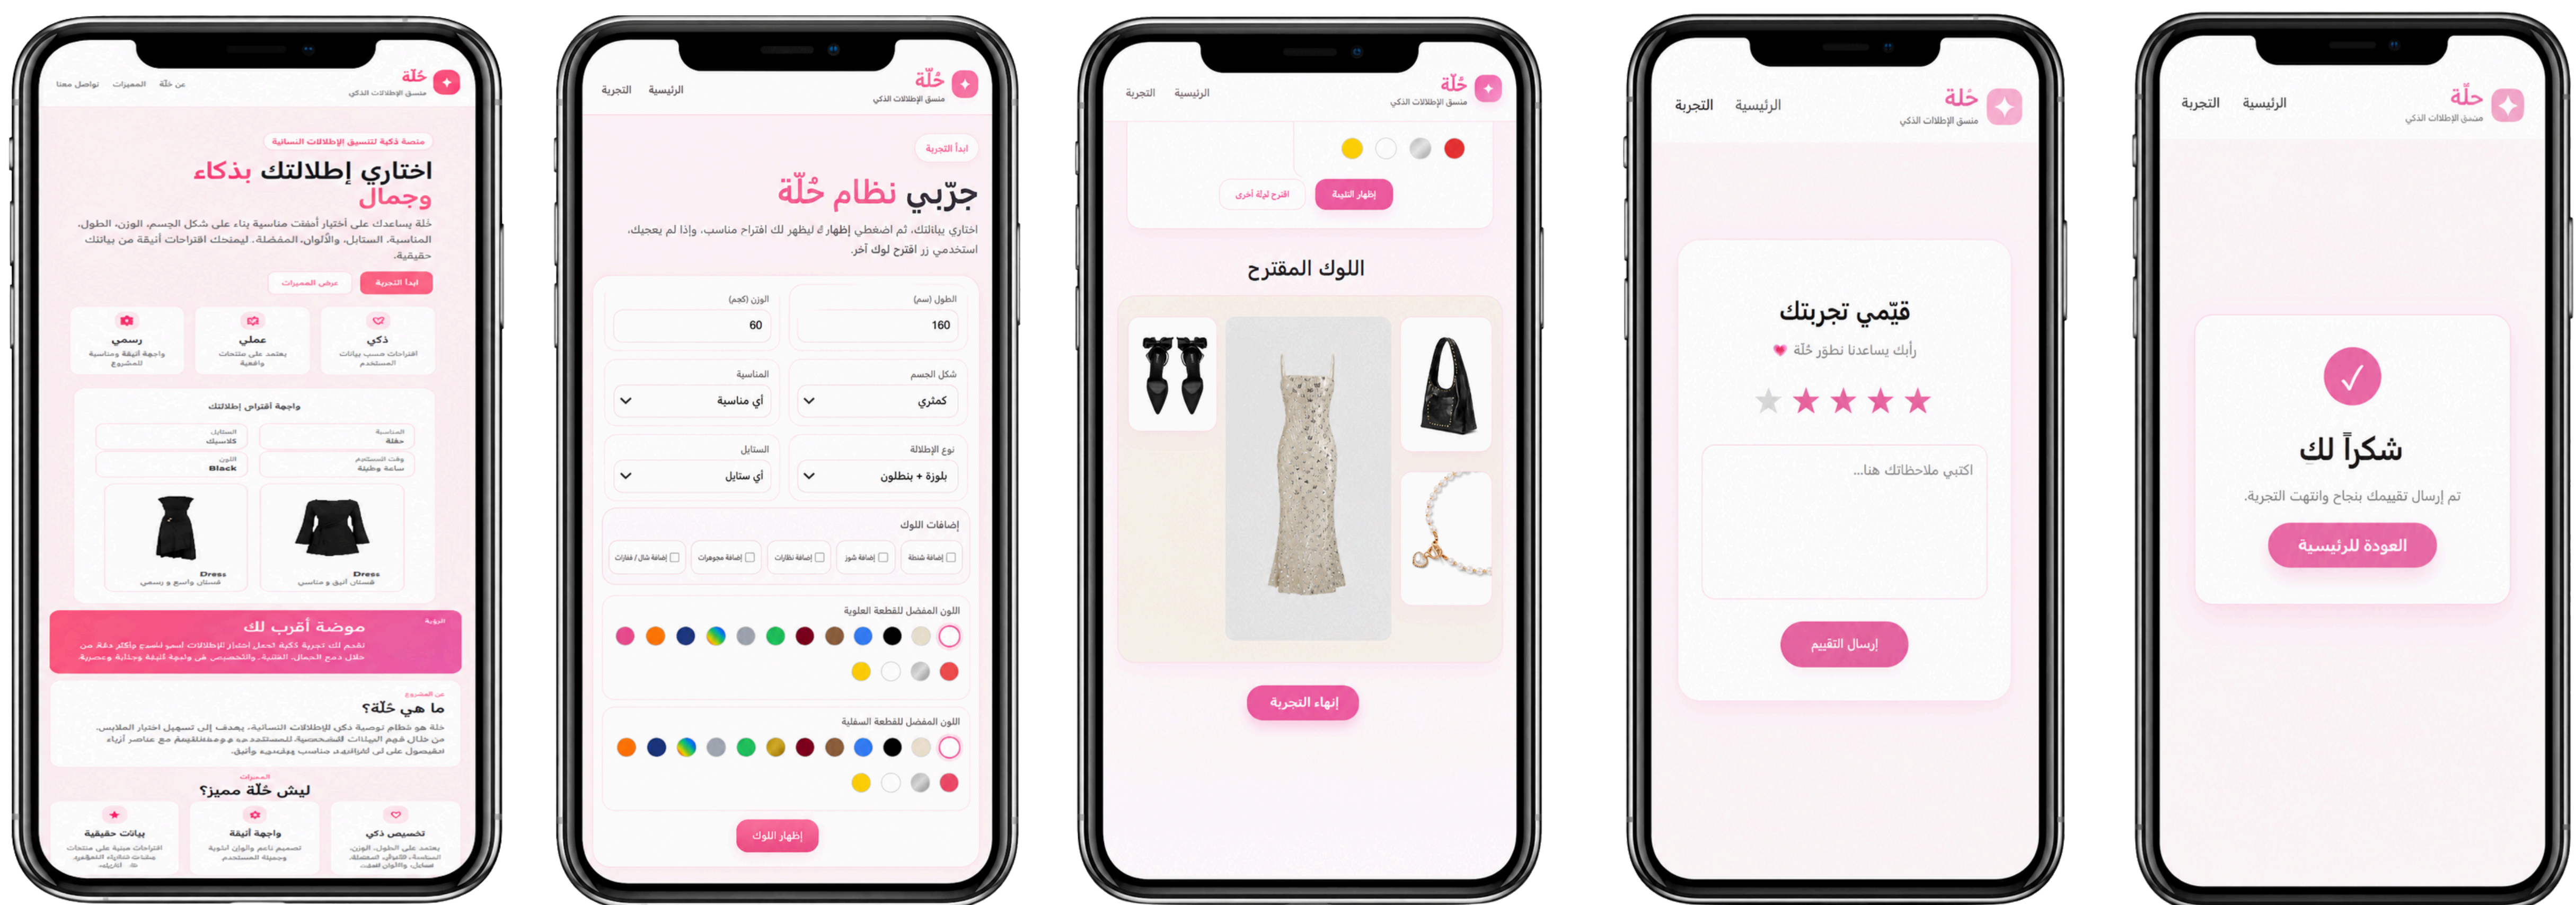

Hullah , an outfit recommendation system designed for female users ,the name reflects its goal of providing elegant and complete attire suggestions, the system generates personalized outfit recommendations based on user characteristics such as height, weight, body type, occasion, color preferences, style, and the desired number of suggestions.

Using artificial intelligence, the system compares user inputs with clothing items in its database to identify the most suitable matches, this process helps users easily select outfits that align with their preferences.

Objective

- Make outfit selection fast & easy.
- Provide personalized outfit recommendations.
- Help users choose confidently.
- Save users time and effort.

Experiments

- The system was tested using different user inputs such as body type, occasion, and style.
- It generates personalized outfits using filtering and AI-based similarity.
- The results show accurate and fast recommendations that match user preferences.
- Users can also rate the results, provide feedback, and complete the experience successfully.

Conclusion

- The HULLAH system provides personalized outfit recommendations based on user preferences.
- It combines filtering and AI-based similarity to generate accurate and relevant results.
- The system is fast, easy to use, and effective for all users.
- Future work includes expanding the dataset and improving recommendation accuracy.

Methodology

Hybrid Recommendation Engine

- Data Processing: Cleans and categorizes raw fashion datasets.
- Hybrid Scoring: Blends AI (70% semantic style matching) with Rule-Based logic (30% physical trait filtering).
- Intelligent Styling: Assembles complete outfits using algorithmic color harmony and context filters.
