SUPERVISOR

Dr. Mohammed Alsuhaibani

Problem Statement

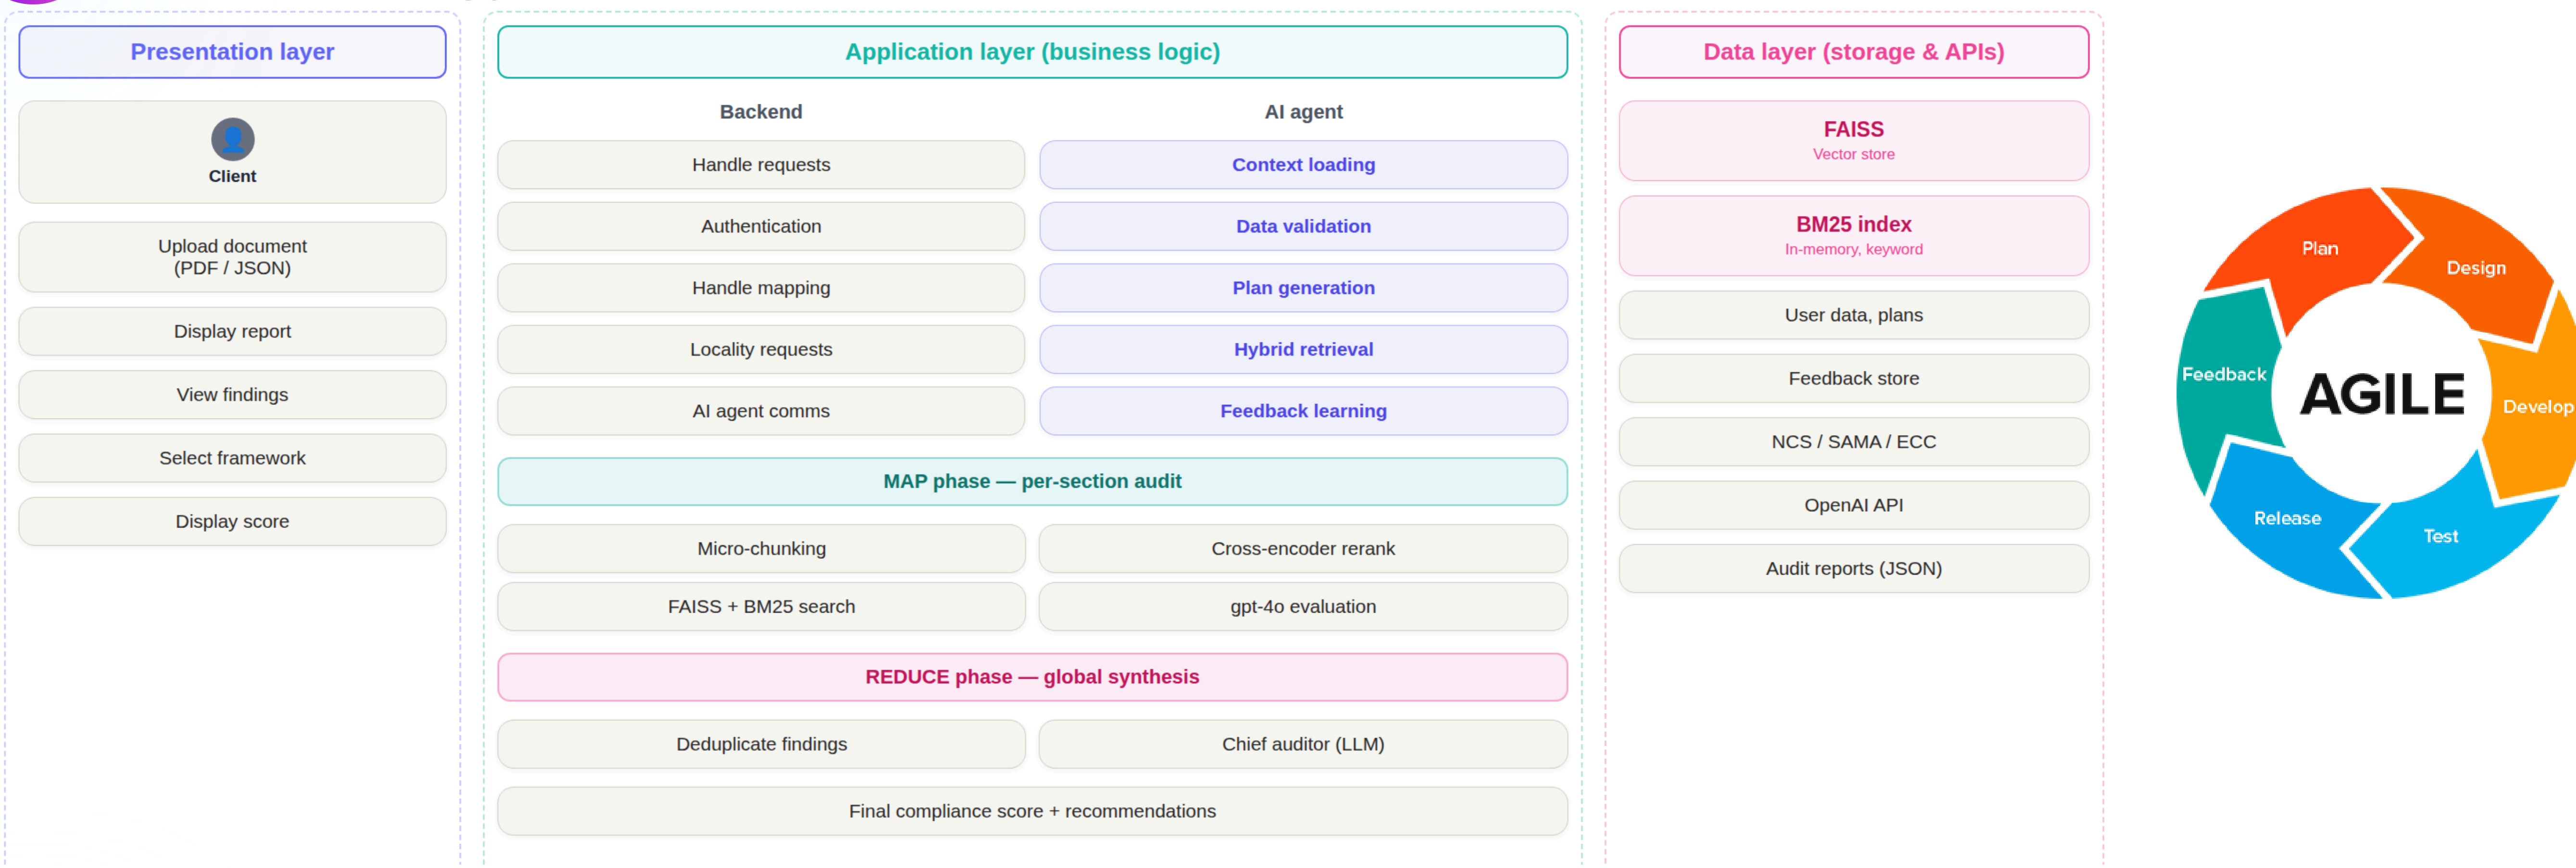

Saudi Arabia leads globally in cybersecurity, ranked **#1 in the UN GCI 2024** with a perfect score. Yet organizations still struggle to achieve compliance with frameworks like **NCS ECC** and **SAMA CSF** — each containing 100+ controls that demand expert review across hundreds of policy documents.

- **Time-consuming** — manual audits take weeks for large organizations
- **High error rate** — 114+ controls cause inconsistent scoring across reviewers
- **Costly** — requires experienced auditors and repeated assessment cycles
- **Inconsistent** — judgment differences between auditors skew final results

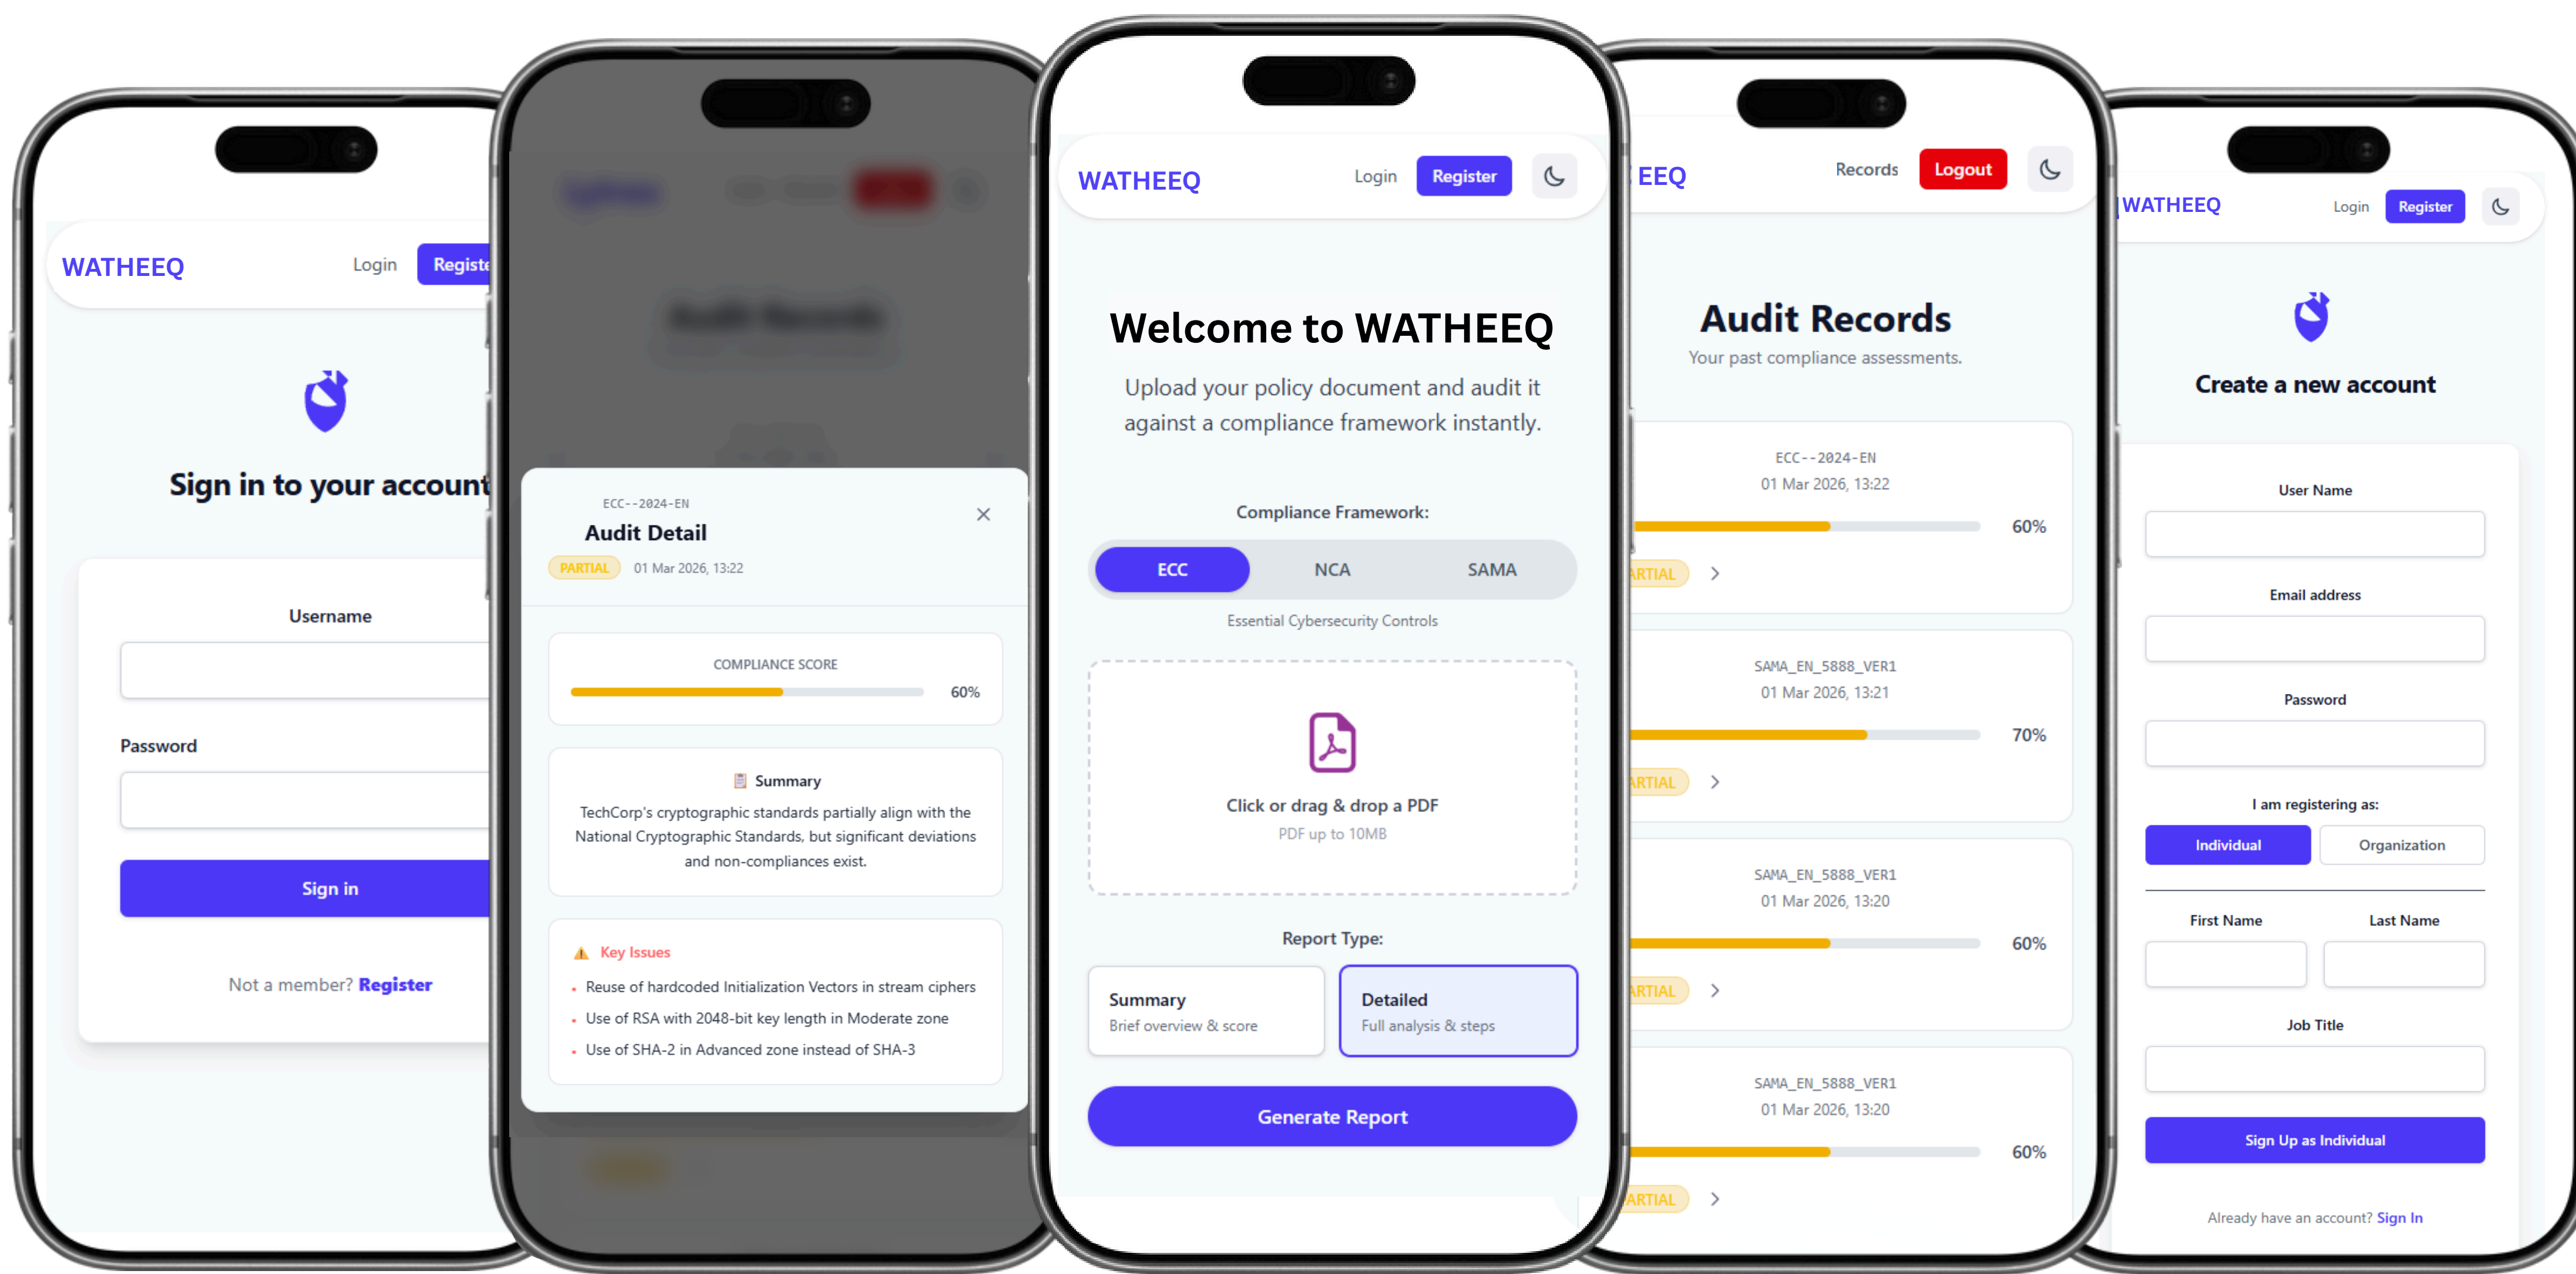

Aims & Objectives

- Fully **automate compliance verification** across multiple cybersecurity frameworks
- Implement **RAG pipeline** over official KSA & international standards
- Achieve **≥ 90% accuracy** in control mapping validated by auditors
- Build a bilingual web interface accessible to non-technical users
- Design scalable architecture ready for new frameworks (NIST, GDPR)
- Generate **Demo** & **Detailed** PDF audit reports automatically

Methodology

Interface Design

Future Work

Expand Frameworks

Add NIST CSF 2.0, GDPR, HIPAA, and sector-specific compliance standards

Fine-tune LLM

Domain-specific training on Saudi regulatory texts for higher precision

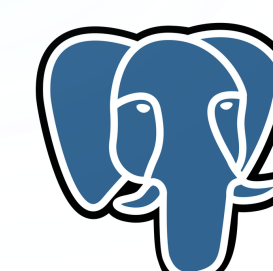

Continuous Monitoring

Real-time alerts when policies drift from compliance requirements

Enterprise & Mobile

Mobile app + integration with ServiceNow, Jira, and GRC platforms

Tools Used

PostgreSQL

Python

Langchain

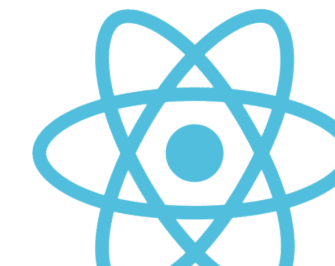

Faiss

HuggingFace

Django

React

OpenAI
