What is MIYAR?

Miyar is an integrated, interactive system designed to revolutionize human resource management and evaluation by applying artificial intelligence and intelligent motivation techniques.

How It Helps Managers :

Simplifies the evaluation process by providing a clear overview of employee performance. Acts as a supportive AI advisor to help managers make confident and fair decisions.

Smart Rating Correction :

Instantly intervenes if a manager accidentally enters a rating that does not match the employee actual effort. Notifies the manager that the entered score does not reflect the objective system metrics.

AI Recommendations :

Automatically calculates and suggests the natural and fair score range for the employee. Protects the manager from unintentional errors and ensures the employee receives a fair evaluation.

Gamification & Motivation:

Enhances the interactive work environment by integrating gaming elements and healthy competition to boost employee engagement.

Methodology & Technologies

Frontend: React.js, Int design
Backend: REST API, django

AI

- Random Forest Classifier for Bias Detection
- Random Forest Regressor for Performance Prediction

USER JOURNEY

The employee searches for assigned tasks using the search bar or task filters in the dashboard.

The employee starts the task (which updates its status programmatically). Upon completion, they click the submit button to change the task status to "Completed".

The workflow returns to the employee. Once evaluated by the manager, the system automatically displays a "View Evaluation" button.

The workflow moves to the manager's dashboard. Once the system detects the 'Completed' status, the 'Evaluate' button appears, allowing the manager to evaluate the employee.

The employee can view their performance details transparently to review strengths and managerial feedback.

When the manager clicks the button to open the evaluation window, inputs the employee's score, and approves it in the system (updating the task status to "Evaluated").

Key results:

100%

Testing accuracy in bias detection

99.48%

Stable performance confirmed via 5-fold cross-validation

99.99%

R-squared with a Mean Absolute Error of 0.08 points on unseen data

Real-Time ML Integration

The models achieved very high accuracy because they were trained on synthetic data. Since the data was generated using fixed mathematical rules without randomness or noise, the algorithms were able to learn the patterns perfectly.

Conclusion:

Miyar demonstrates the effective integration of AI with web technologies to improve employee performance management. It ensures accurate, fair, and efficient evaluations, providing a strong foundation for intelligent and scalable HR solutions.
