An AI-Supported, Culturally Adapted Family Organization Platform

Project Summary

- A unified mobile application designed to centralize family coordination.
- Eliminates the need for fragmented tools (WhatsApp, Notes, Calendars) by providing one cohesive, Arabic-first platform.
- Fully functional and deployed on mobile app stores

Problem & Motivation

- Fragmented Tools: Families rely on multiple disconnected apps, leading to information silos and missed tasks.
- Lack of Intelligent Support: Existing tools do not provide sufficient AI-driven assistance for user activities.
- Localization Gap: Existing family organizers lack proper Arabic language support, RTL design, and cultural alignment.

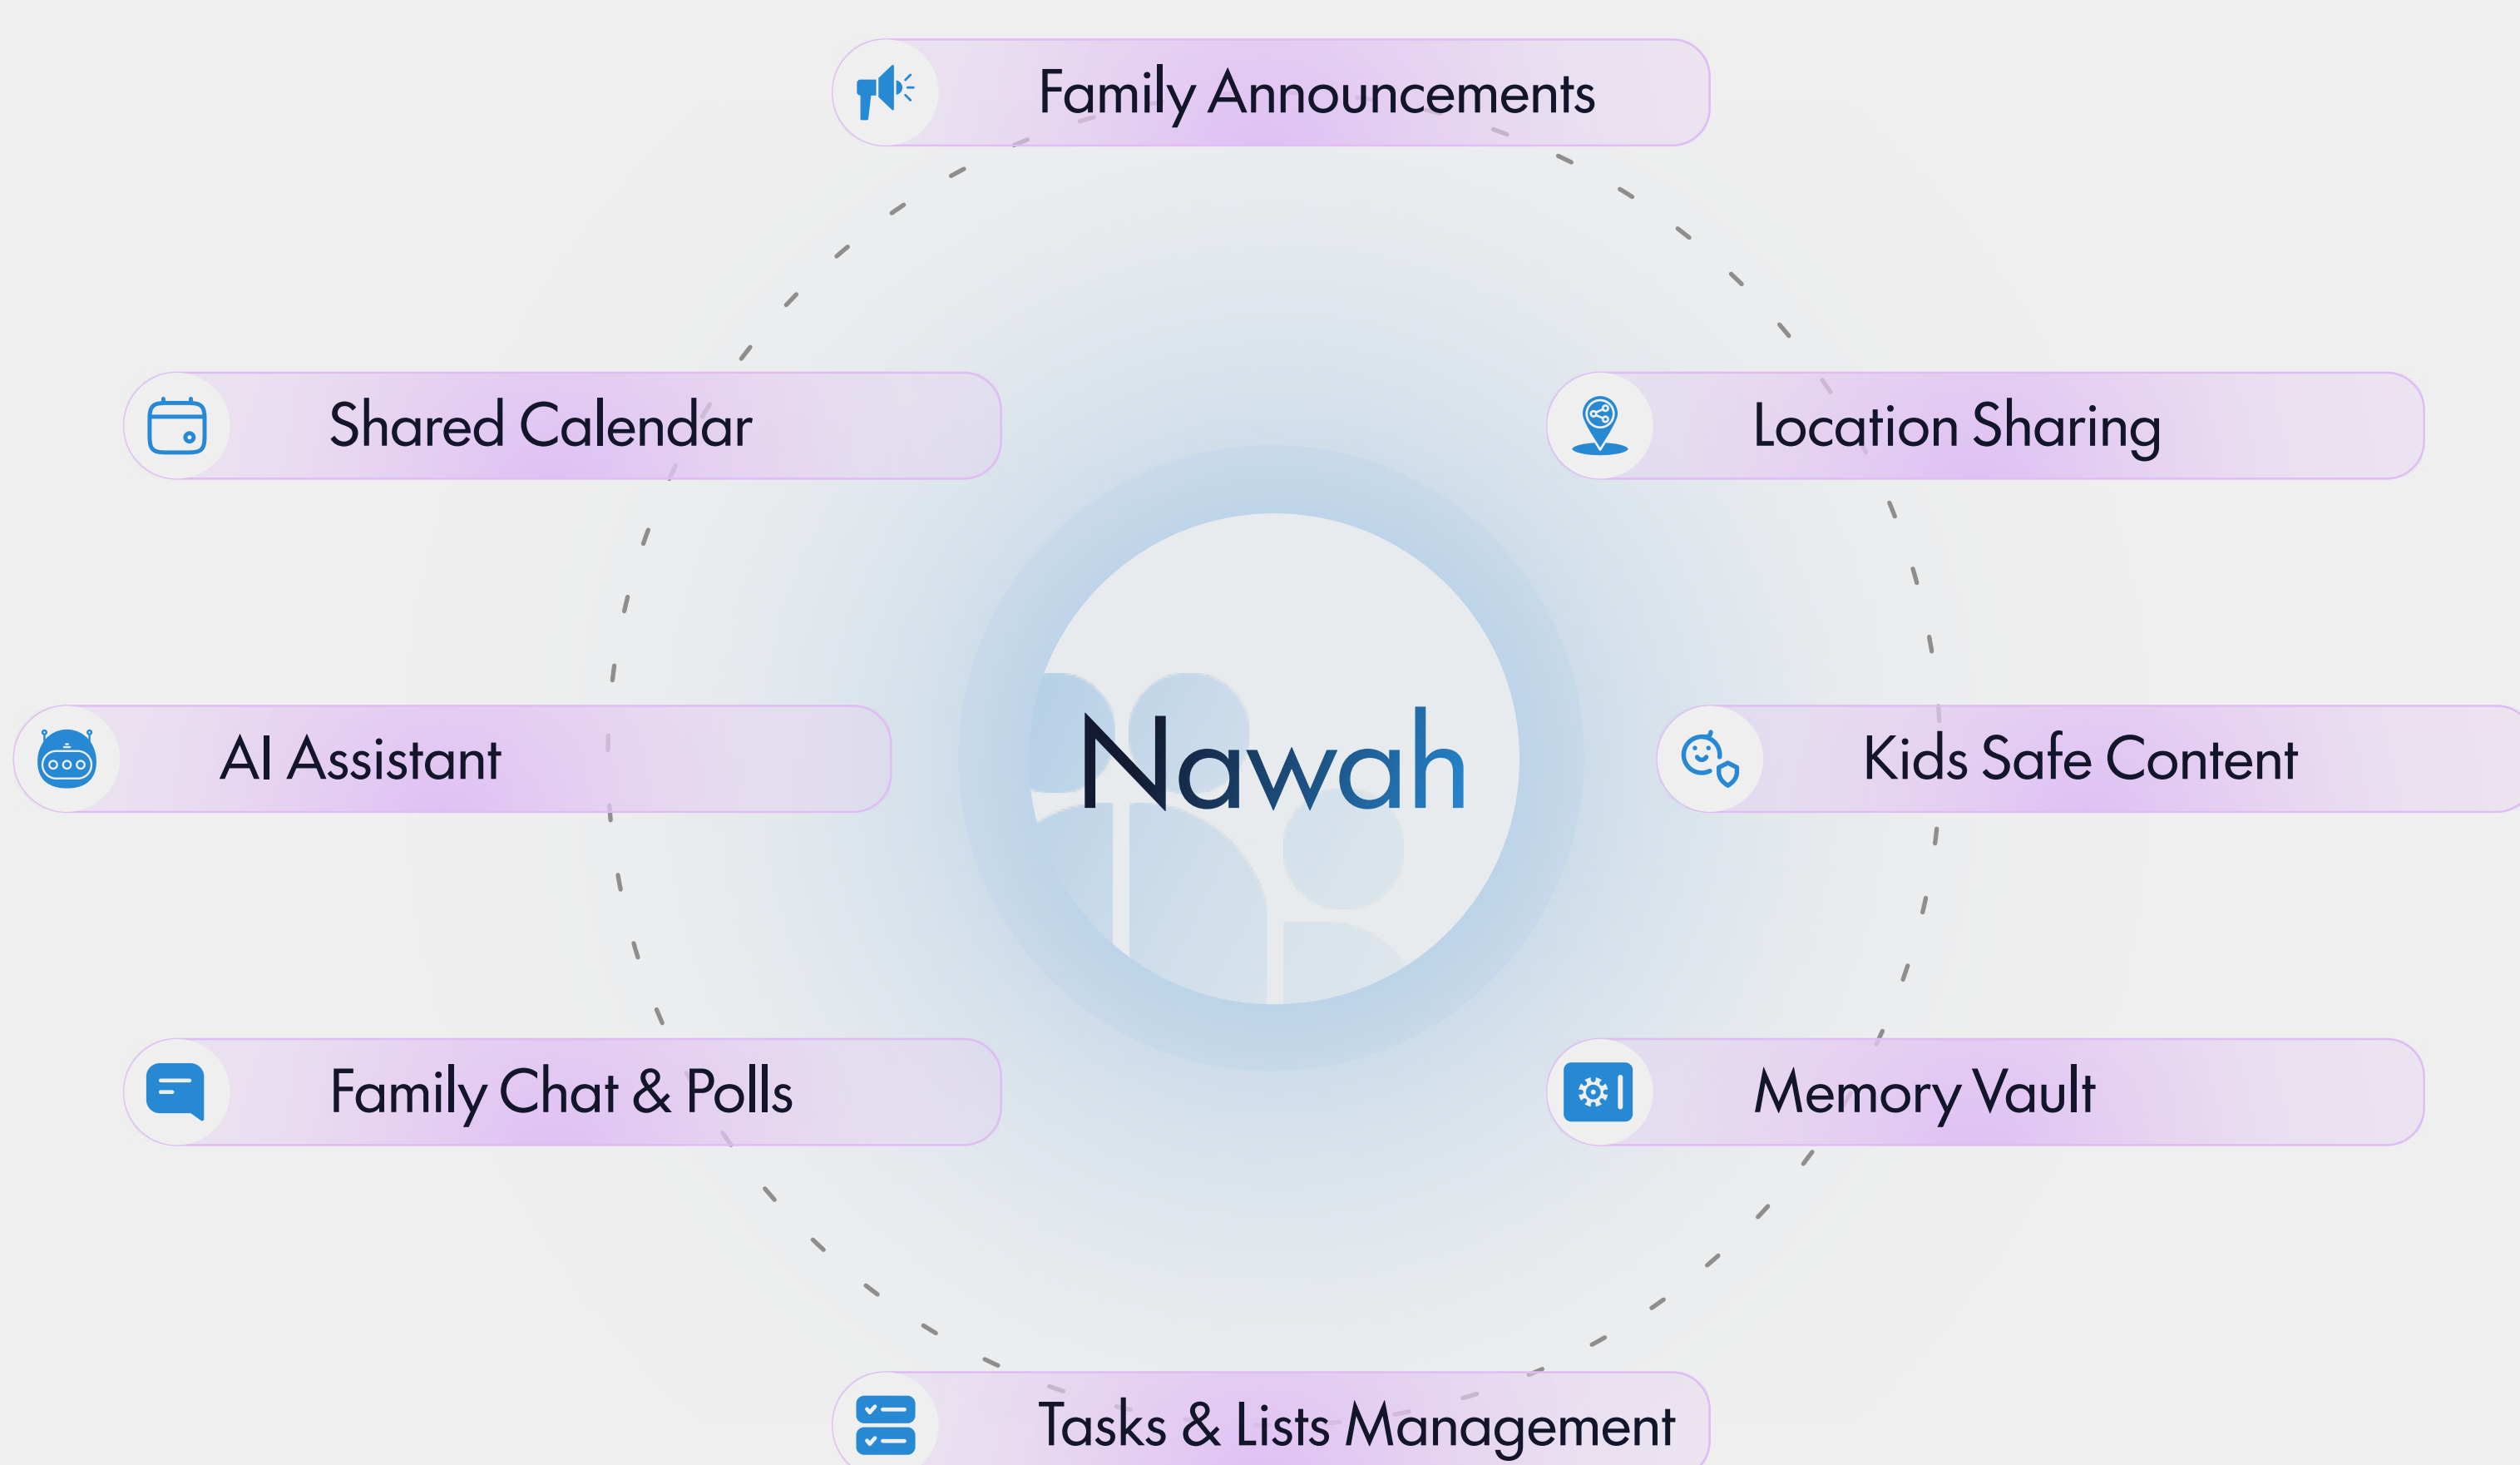

Methodology

- Developed using a Feature-based Clean Architecture.
- Iterative Approach: Requirements analysis → Modular design → Development → Continuous testing.
- Utilizes event-driven, real-time synchronization between the mobile client and the cloud.

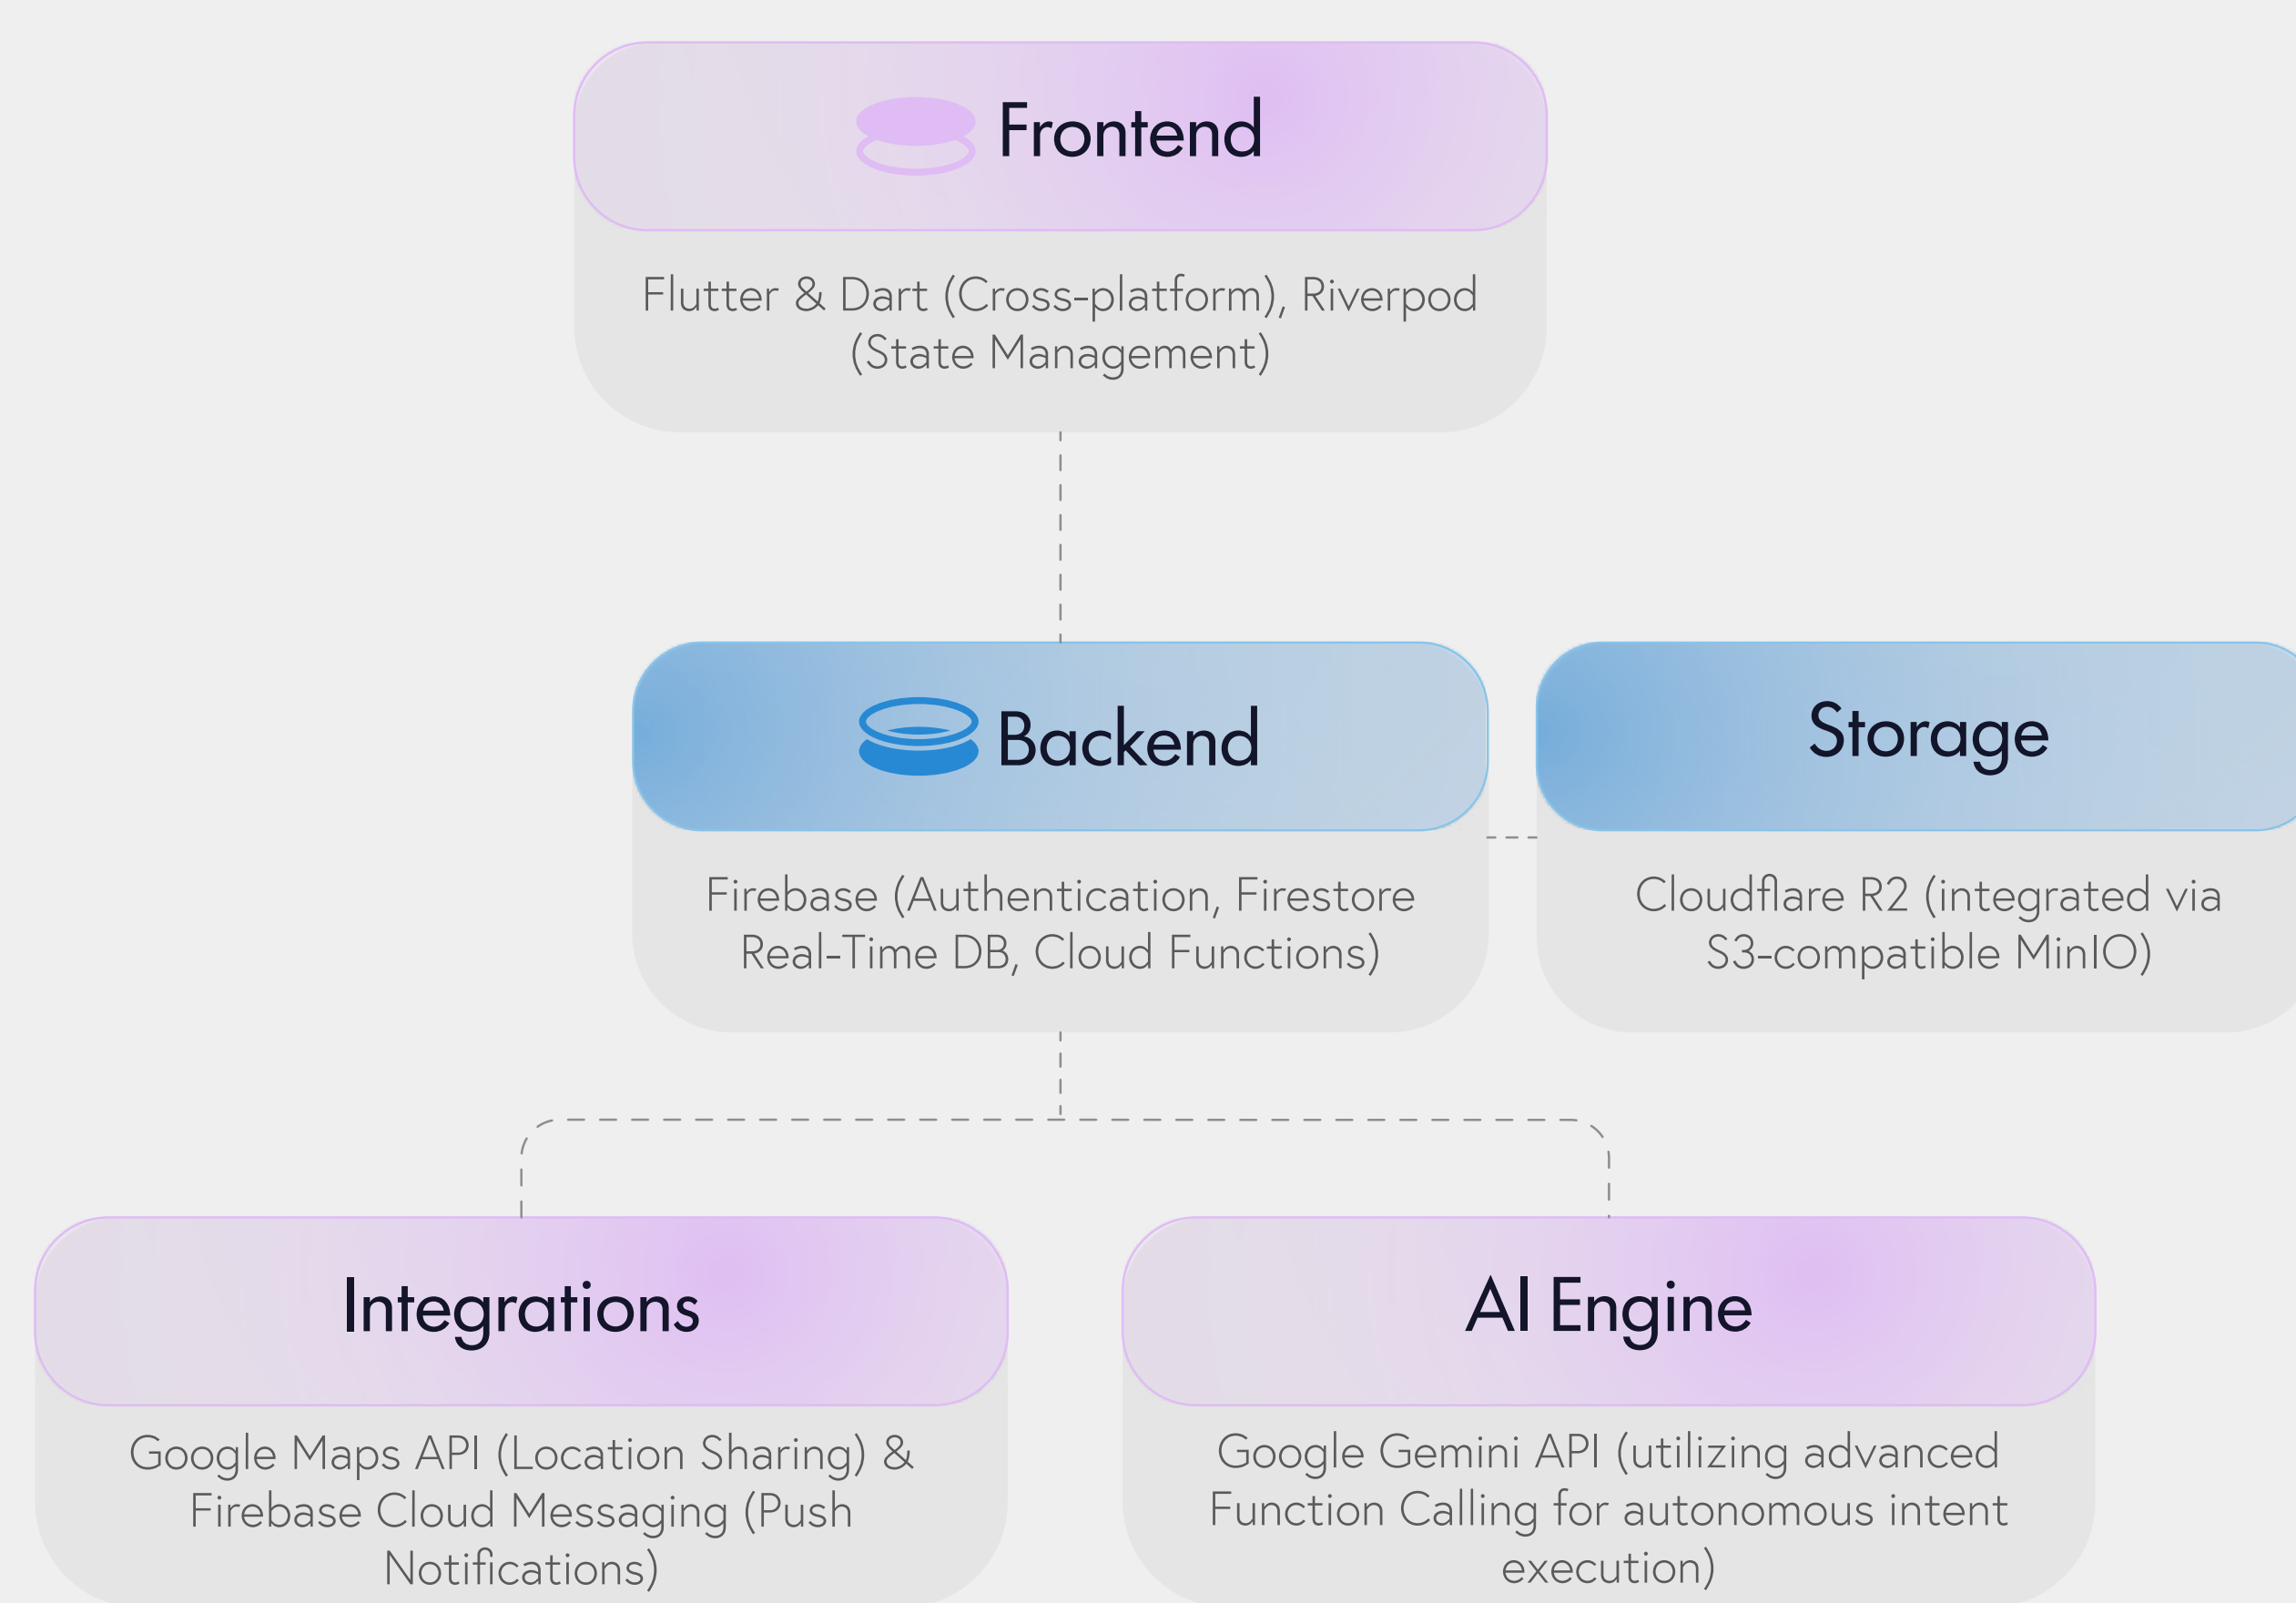

Solution

- Unified Platform: Integrates communication, scheduling, and task management.
- Vision 2030 Alignment: Supports Saudi digital transformation goals by enhancing quality of life and strengthening family cohesion.
- Cultural Design: Built specifically around the communication habits of Arabic-speaking families.
