

12 M

people experience a stroke each year, making it a leading global emergency that can cause death or long-term disability if treatment is delayed. Early detection and timely intervention significantly improve outcomes.

Introduction

StrokeWatcher is an AI-powered mobile application designed to support early stroke detection before hospital arrival. It analyzes facial expressions, speech, and user responses to structured questions to assess potential stroke symptoms. The system generates a concise triage card summarizing the user's condition, including Triage Level, onset window, assessment results, recommended actions, and Medical ID By providing real-time guidance, StrokeWatcher aims to enable faster decision-making and improve outcomes in emergency situations.

Goals

- Develop an AI assistant for user interaction.
- Detect facial droop, analyze speech, and perform Q&A assessment.
- Provide emergency guidance and hospital referral
- Generate a digital Triage Card.
- Educate users about stroke symptoms simply.
- Support future integration with emergency healthcare systems.

Methodology

User Interface

survey

Conclusion

StrokeWatcher The project emphasizes practical usability, combining multiple assessment techniques within a simple and accessible interface. By focusing on awareness, ease of use, and immediate guidance, the system contributes to bridging the gap between symptom onset and medical response, demonstrating a step toward more proactive and responsive emergency care.
